

When discussing possibility of another intelligent life form existing in the Universe, beside our human civilization populating Earth, I encounter surprising narrow mindedness. I mean, on the one hand people are ready to accept existence of an absolute being, creator deity, but on the other hand they refuse to accept existence of an intermediate level, higher specie of sort, which is more easier to comprehend and prove. Mostly due to early religious indoctrination, starting in childhood, resuming during school age and later, actually it is no wonder why they incline towards preprogrammed resolving. Although, angels could be terms representing advanced extraterrestrial specie(s), accidentally or intentionally, misused by clerical hierarchy - regardless of denomination. I have found a number of references in holy scriptures, unambiguous in such extent, which I can only relate to superior technologies observed but lacking appropriate contemporary vocabulary to precisely describe them.

If narrow mindedness becomes a railway track - the train driving on it would never leave the station.

Recorded human history is around ten thousand (10.000) years long. Compared to the Universe age, or at least age of Earth, it is of insignificant value. Despite that fact, scientists like Fermi ask why haven't we been contacted by aliens. It is very short period of time in very small part of Cosmos. To believe that we (current Gaia inhabitants) live simultaneously in special time and special place is exaggeration as well as considering ourselves unique in the surrounding vastness of spacetime. Moreover, for the most segment of our history we didn't have modern, nowadays equipment to survey either astronomical or subatomical planes.

When evidence and testimonies happen they are pushed under carpets, camouflaged, attributed to different causes or destroyed because admitting the truth would certainly ruin an established systems of belief and, consequently, deprive related elites of their power based on supposed divine structural order determined in esoteric, exclusive circles.

"Omuamua" and "Barney and Betty Hill incident" cases are great examples.

## Omuamua

As explained by dr. Avi Loeb, professor of Science at Harvard University, during an interview at "Our future in space" 2021. forum in Washington National Cathedral - Omuamua extraterrestrial object was detected in 2017. when it was leaving our Solar system. It didn't have evaporating cloud typical for comet nor it reduced its weight. It shown non-gravitational acceleration. Elongated, slightly bent form with tumbling movement was assessment based not on direct observation but exhibited reflection curvature while its actual size and shape appeared as light source coming from a single point. Dr. Loeb wrote a book about this object suggesting it could be an alien artefact.

Galileo Project, somewhat influenced by Omuamua, is the systematic scientific search for physical objects associated with an extraterrestrial technological equipment. More precisely, it is an examination of Unidentified Aerial Phenomena (UAP) origin using network of satellites and high-resolution telescopes as part of integrated, multi-wavelength detector arrays operated by AI algorithms.

## Barney and Betty Hill incident

Barney and Betty Hill incident took place in 1961. Several facts make this alien abduction case very interesting. First, their credibility as being both government employees (postal service / social worker) and decent folks not engaged in vices like drugs or alcohol. Second, they told almost the same story under hypnosis performed by psychiatrist dr. Benjamin Simons who was an acknowledged expert in therapeutic practices. Third, they had observable neurological and physical symptoms. They experienced missing time of several hours. Fourth, they didn't seek publicity. Fifth, Betty made a sketch depicting stars not yet discovered by astronomers. Sixth, Barney died 1969. from intracerebral hemorrhage (hemorrhagic stroke) - just eight years after the incident.

Amateur map analysis indicated that starting point in Betty's sketch could be Zeta Reticuli binary solar analogs located about 39 light years from Earth, Beryllium depleted and belonging to Zeta Herculis moving group of traveling stars. Finding was challenged by famous astronomer Carl Sagan. However, few years later he led NASA team which sent comprehensive Earth data,

recorded on two golden discs, into the space. Binary star system, two golden discs sent few years later - what a coincidence. Walter Mitchell, professor of astronomy at Ohio State University, used computer technique to generate the nearby star positions and got the corresponding pattern therefore confirming initial findings of Betty`s drawing.

Regarding Barney`s death, intracerebral hemorrhage is a sudden bleeding inside a brain. Nowadays medicine uses computed tomography scan (CT) for diagnosis. Barney`s condition could have been a direct consequence of an abduction or caused by a post-traumatic stress disorder.

Dr. Garry Nolan research

Dr. Nolan, professor of pathology at Stanford University, along his usual medical interest in cellular diseases and immunology also investigates materials associated with unidentified anomalous phenomena (UAP) as well as brain health and blood analysis of military, intelligence, other government personnel and an aerospace industry employees exposed to intricate environment, even UAP encounter. Studying their MRI scans he discovered that damaged parts resembled those of patients diagnosed with multiple sclerosis (white blobs scattered across). Particular brain regions, like caudate putamen, were severely affected having over-connection of neurons with 5-15x matter density increase. These areas serve for higher neurological functions, like intuition, and motor skills. Symptomatology was identical to Havana Syndrome linked to 2016. Cuba sickness features of unknown origin.

## Strange materials

Using mass spectrometry dr. Nolan examined substances found at Council Bluffs, Iowa, and Ubatuba, Sao Paulo, Brazil. Results showed different, inhomogeneous metal composition, unusually modified isotope ratios of Magnesium. Dr. Nolan conclusion: materials have likely been engineered... By whom and why?

Science will one day start utilizing super quantum interference devices (SQUIDS) for sub-angstrom level atomic detection which will help better understand structure-function connection. Perhaps then we will have answer who and why made those weird isotopes.

## Atacama skeleton

Examination of alleged alien corpse revealed a number of mutations in skeletal genes. Dr. Nolan concluded that it was human. I do not understand

how can such a DNA difference be attributed to anything else than to a distinct specie. Skull structure, neck length and eye cavities are irresistibly appealing but an expert says it is dysplasia. My question is what is an extent of such reasoning? Can we consider any being other than human, simply, dysplasiastic? Another question, are there similar cases known to medicine? I mean, really similar.

### Atacama desert geoglyphs

Adjacent to Nazca lines in Peru, belonging to the same plateau but more numerous, Chilean drawings carved in ground are oversized, just like neighbouring ones, which makes them best observable from air. Why would ancient people produce images seen from above - much before flying technology was invented? Maybe because they wanted to entertain and communicate with objects passing over their heads?
